

PROCESS 1 / 8

Order Creation & EBS Posting

Dispatch starts in the Asset App; the sale order is created in Oracle EBS by API

Manual / scan step

Asset app function

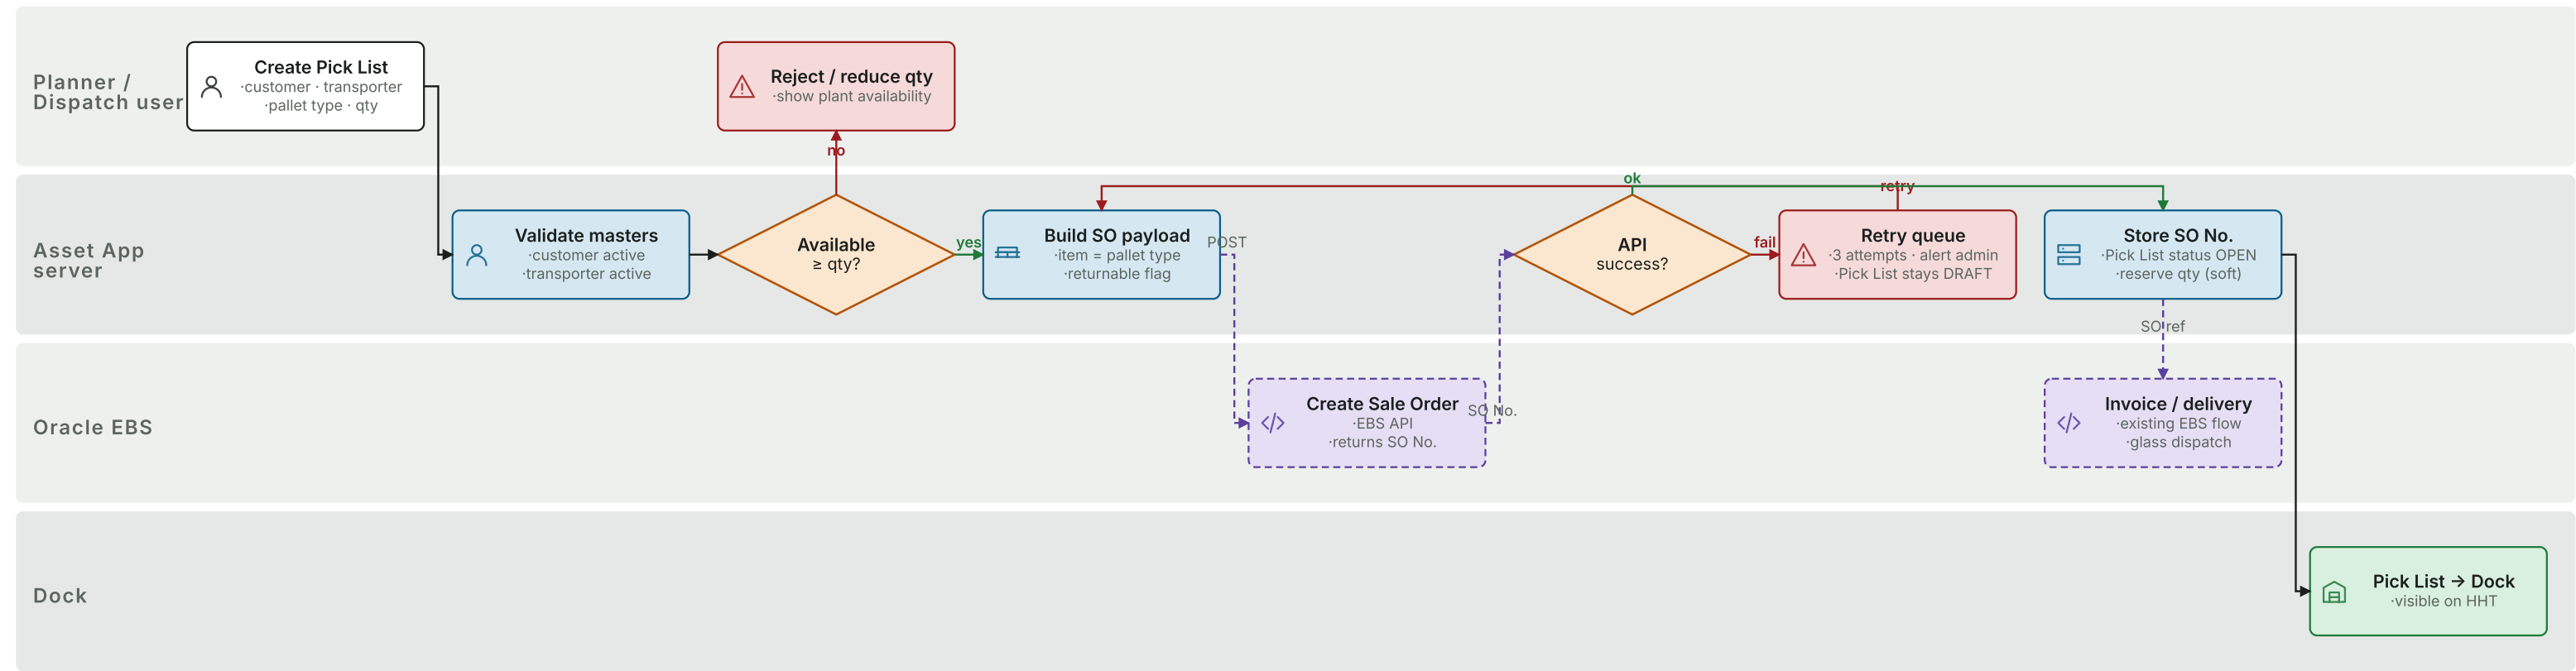

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Who: Dispatch planner creates the Pick List; the app owns master validation and the EBS call.

SO payload: Customer code, ship-to, pallet type as item, qty, returnable flag, Pick List reference in the order header for traceability.

Developed by DT · Pallet Asset Tracking · Process flows v0.4 · Oct 2026

Invoice: Glass invoicing stays in the existing EBS / HMIL flow. The pallet SO is linked by Pick List reference so the pallet challan can print the invoice number.

Edit / cancel: A Pick List can be edited only in DRAFT. After SO posting, changes go through a cancel-and-recreate so EBS and app never diverge.

PROCESS 2 / 8

Dock Out-ward Scanning & Pick List Control

Every pallet leaving the plant is scanned by tag and locked to one Pick List

Manual / scan step

Asset app function

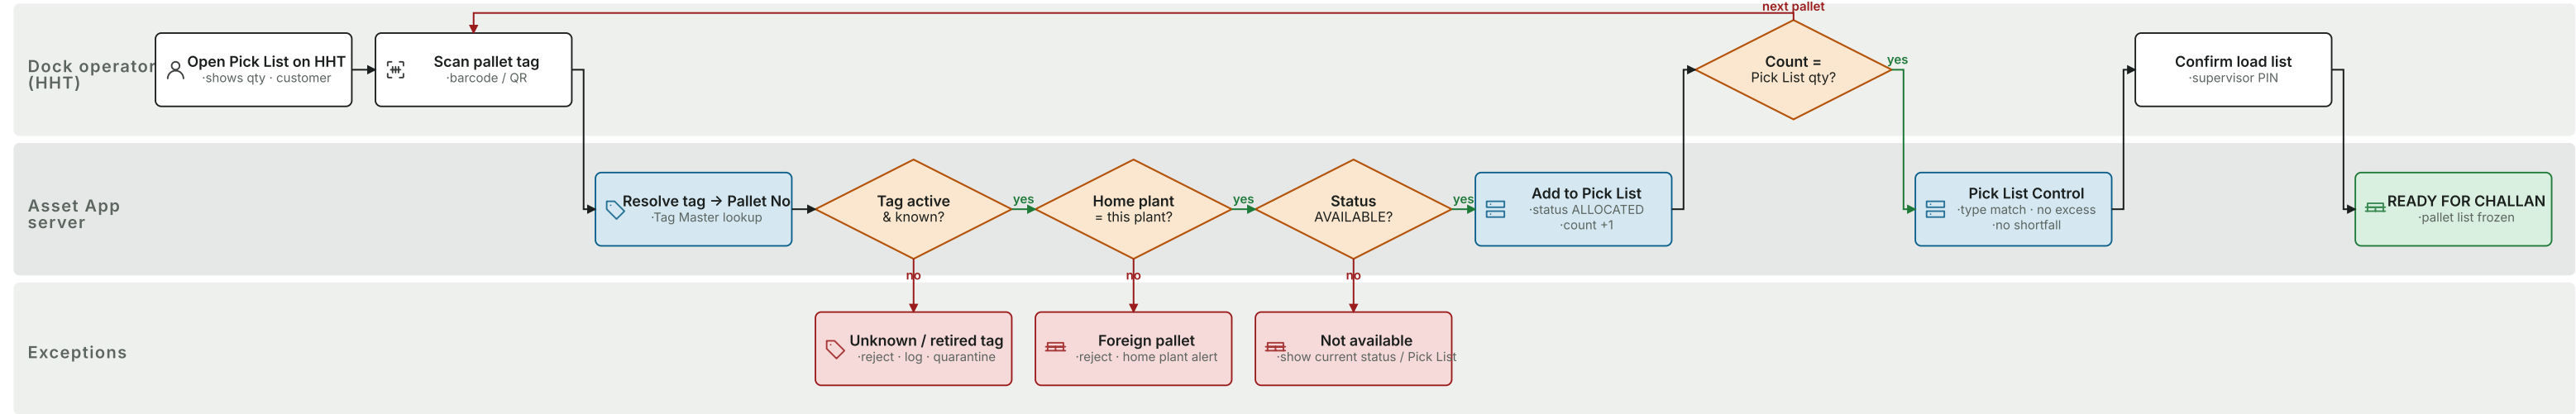

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Duplicate scan: Same tag scanned twice on one Pick List is ignored with a beep, not counted twice.

Remove: Operator can remove a pallet from the list before confirm; it returns to AVAILABLE.

Offline: HHT caches the Pick List and Tag Master; scans are queued and validated again on sync. Confirm is online-only.

Partial load: If the vehicle takes fewer pallets, supervisor reduces Pick List qty with reason; the SO qty is updated in EBS.

PROCESS 3 / 8

Challan → Logistics → GCS Outward → Gate

Challan source switch (ORACLE / APP), logistics approval and system-controlled out-gate

Manual / scan step

Asset app function

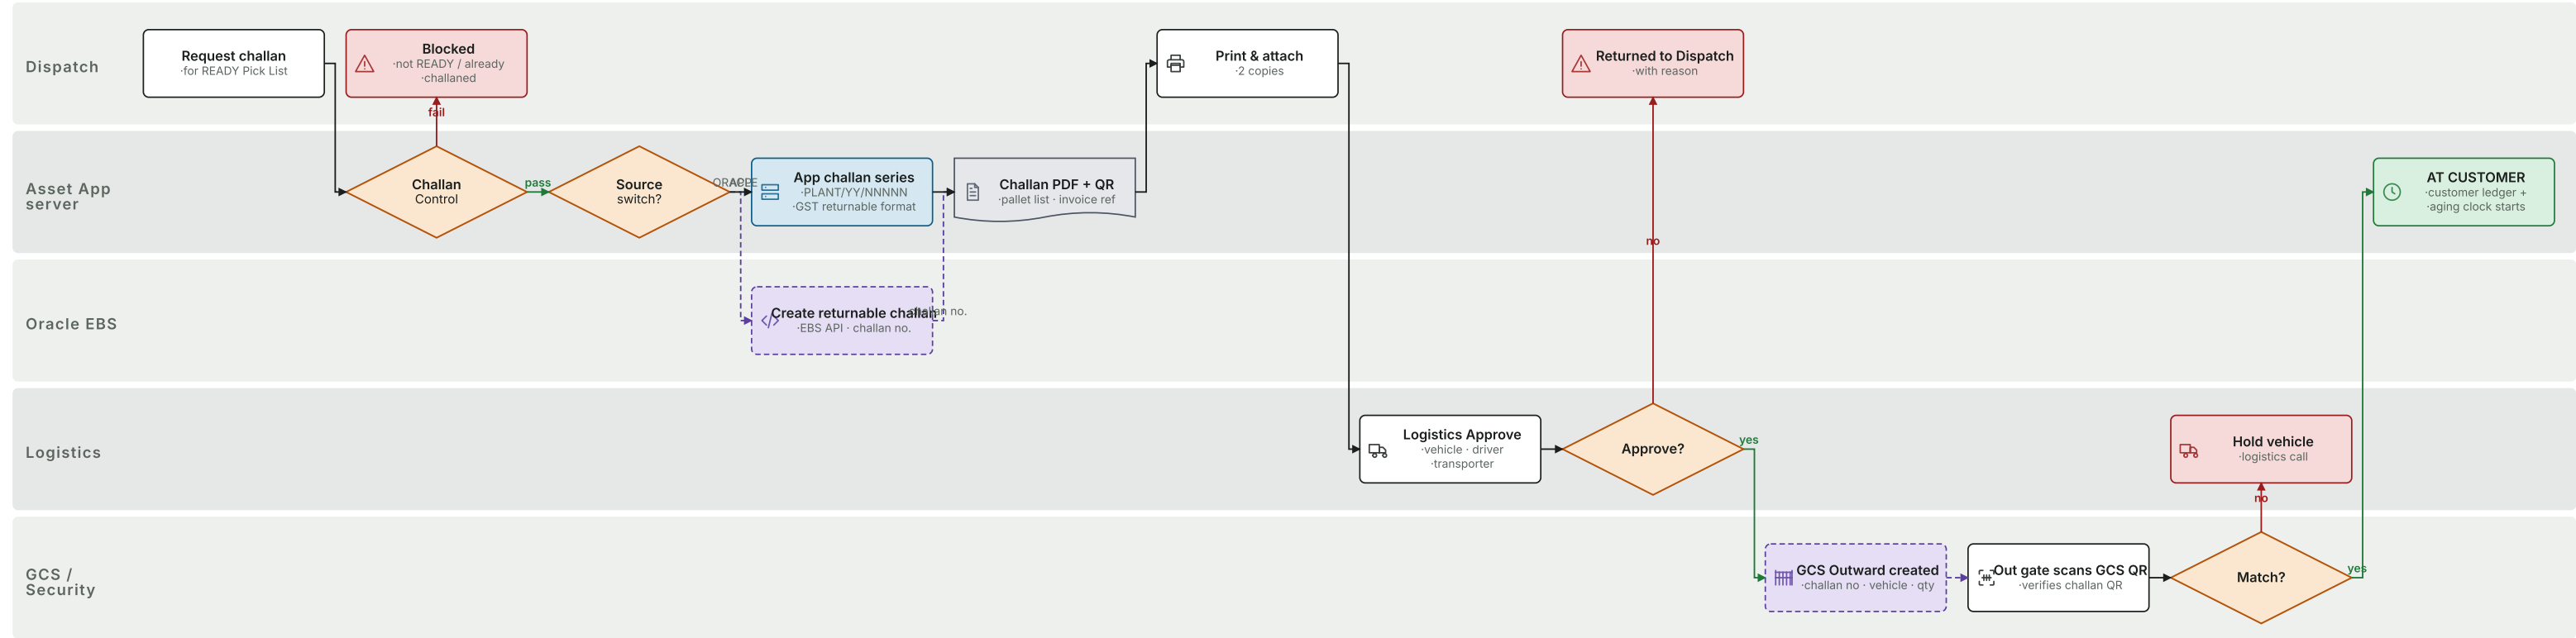

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Switch: Set per plant and overridable per customer in Customer Master. ORACLE mode stores the EBS challan number; APP mode posts its number back to EBS as a reference.

Challan QR: Encodes challan no, Pick List, customer, pallet count and a hash, so the gate and the customer can verify it offline.

GCS: One GCS outward per vehicle; it may carry several challans. GCS approval is auto when the gate scan matches; manual override needs a reason.

After gate: Pallet status AT CUSTOMER, dispatch date stamped, customer ledger incremented by pallet ID, reminder schedule evaluated nightly.

PROCESS 4 / 8

Return Slip Creation (Mode A · Mode B)

One Return Slip (RTS) with QR, created at the customer or at the AIS gate

Manual / scan step

Asset app function

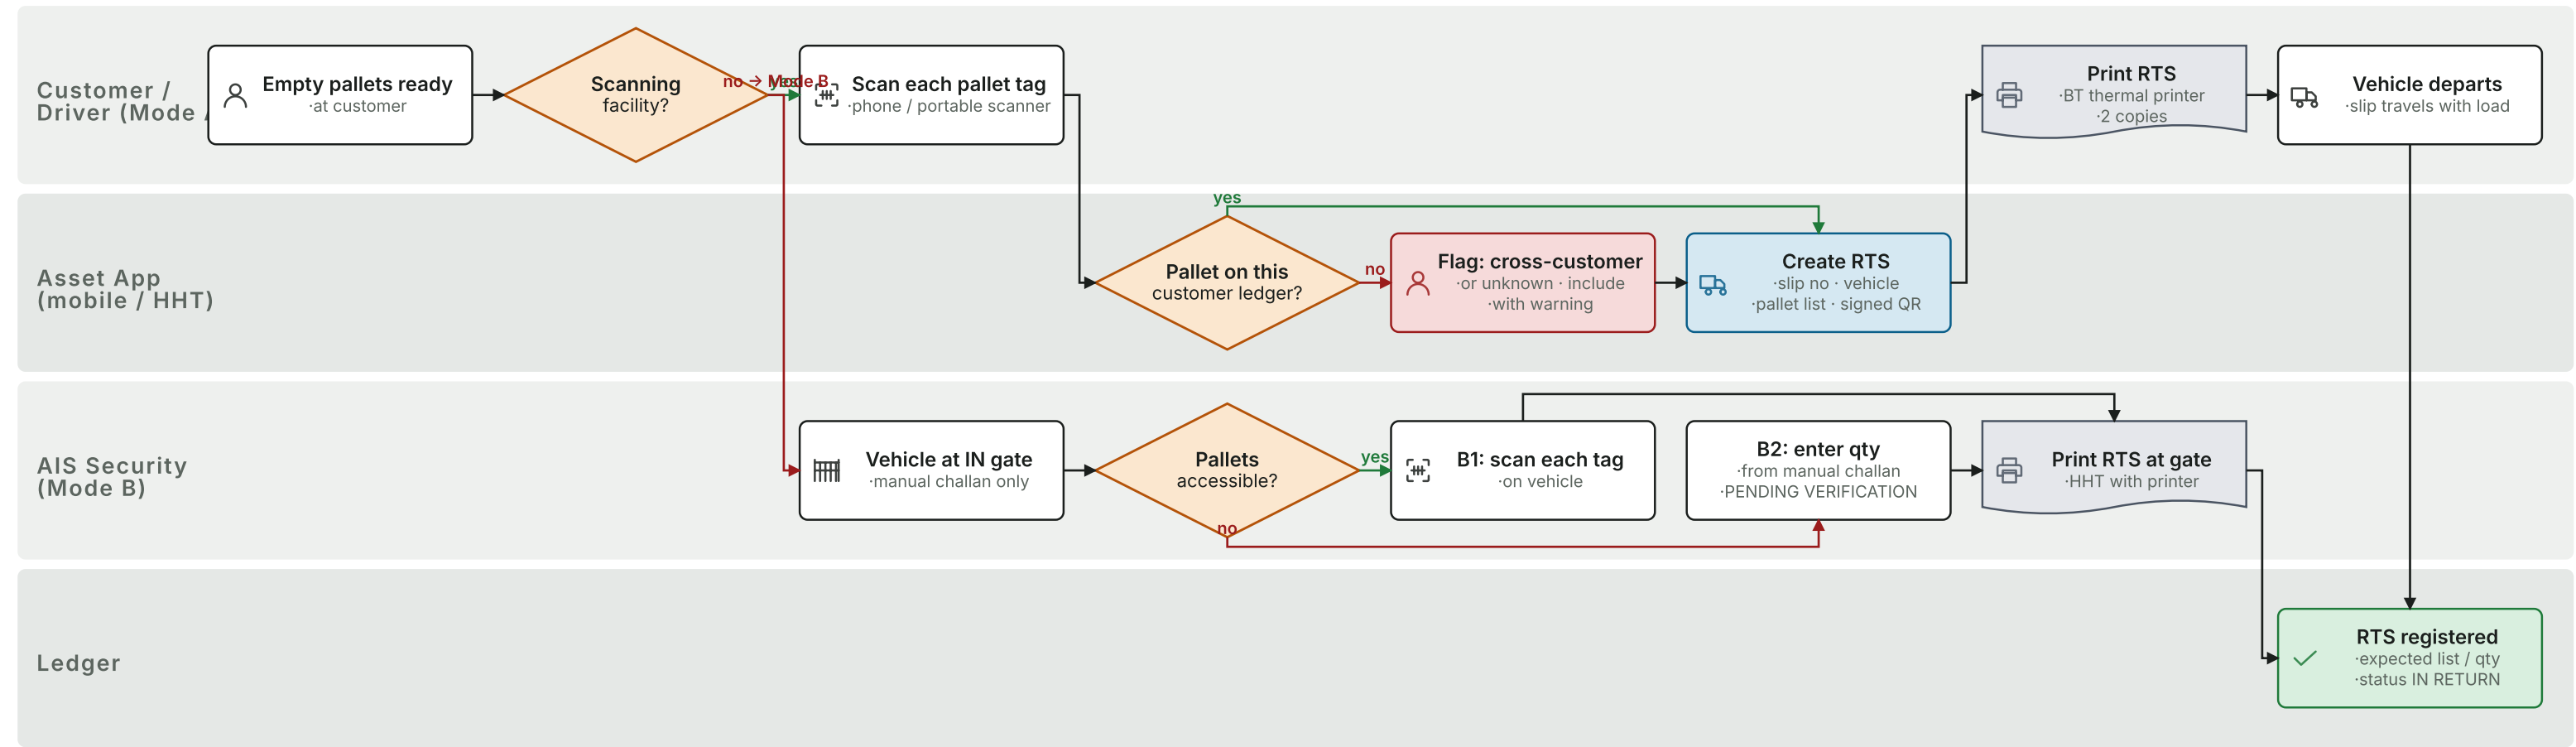

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Mode A kit: Android phone + Bluetooth ESC/POS printer, or a handheld with built-in printer. App works offline; slip syncs when online. Customer login limited to their own ledger.

Signed QR: Slip ID + pallet list hash + timestamp signed by the app key, so the gate can accept it offline and a hand-edited slip fails.

Mode B2: Quantity-only slips are allowed only when pallets cannot be scanned on the vehicle. They stay PENDING until the yard scan supplies the IDs.

Self-service: Customers with a portal login can raise an RTS from their own holding list (Phase 6).

PROCESS 5 / 8

IN Gate → Yard In-ward → Reconciliation

Scan-driven receipt, three-way match and exception handling

Manual / scan step

Asset app function

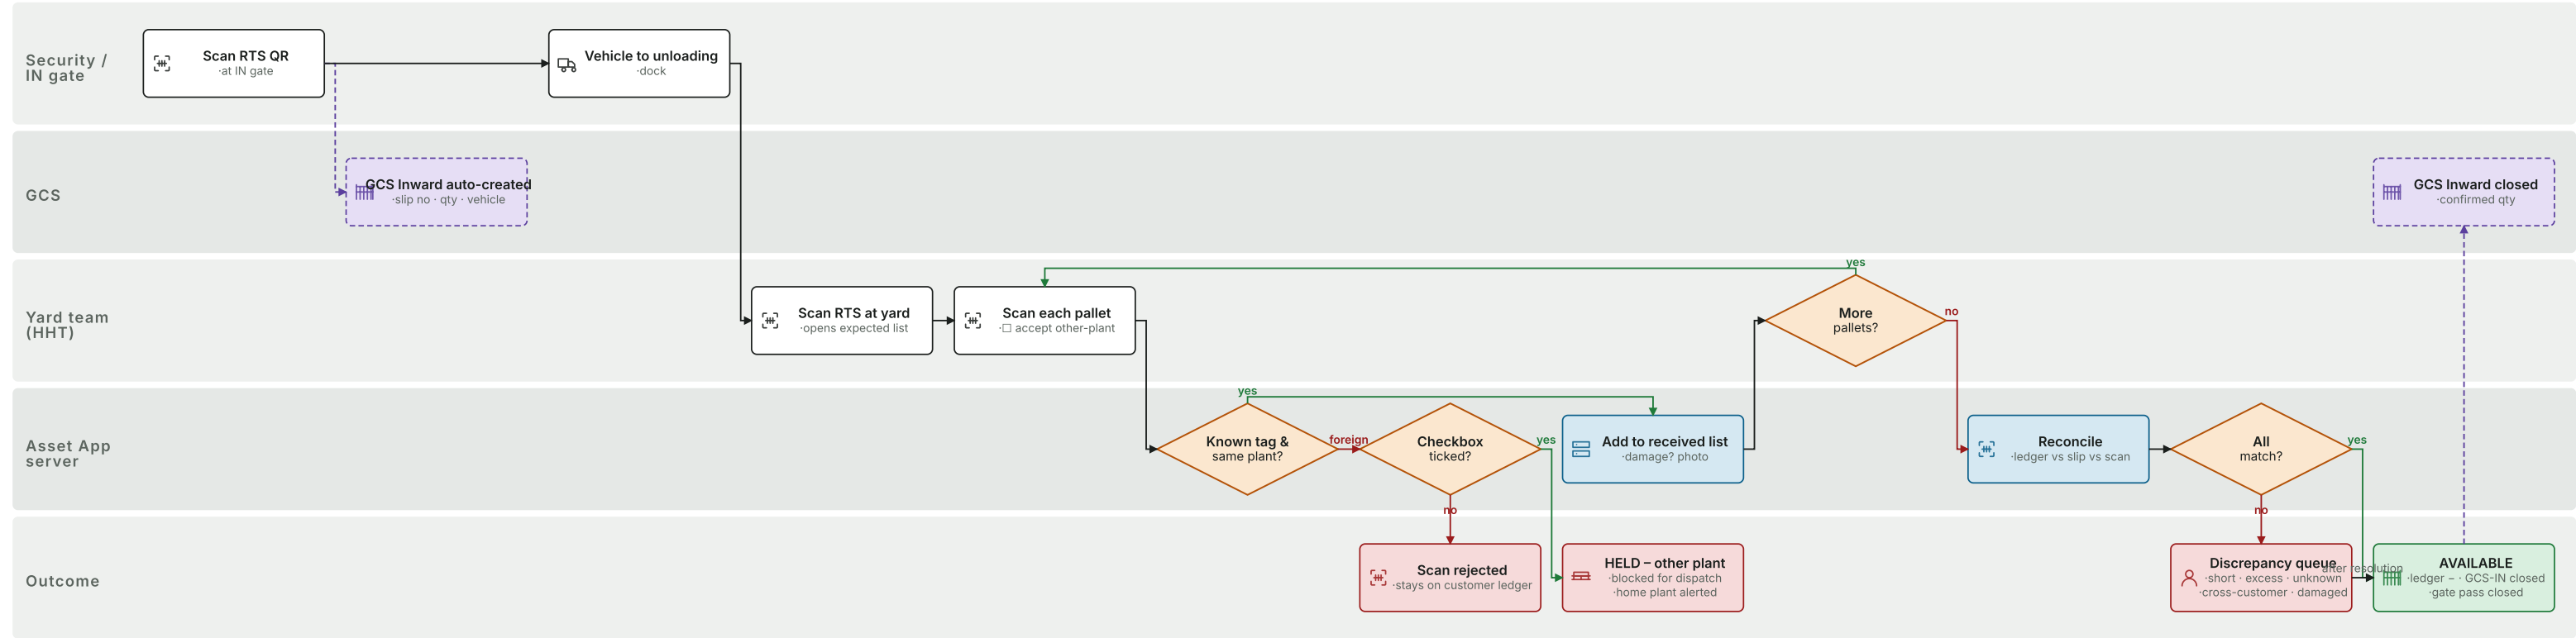

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Short: On slip, not scanned → stays AT CUSTOMER, counted in reminders; customer informed by mail with the slip number.

Excess: Scanned, not on slip → accepted; source customer auto-corrected from ledger; noted on the closure report.

Cross-customer: Pallet booked to customer X arrives from Y → moved between ledgers, flagged for logistics review.

Unknown tag: Not in Tag Master → held in quarantine bin until Master team identifies or re-tags it.

Damaged: Status DAMAGED with photo; chargeable per Customer Master; repair/scrap decided by yard supervisor.

Closure: Only a supervisor can close a receipt with open exceptions; the GCS inward is closed with the confirmed quantity.

PROCESS 6 / 8

Master & Tag Management

Tag series, batch printing, assignment, replacement and pallet discontinuation

Manual / scan step

Asset app function

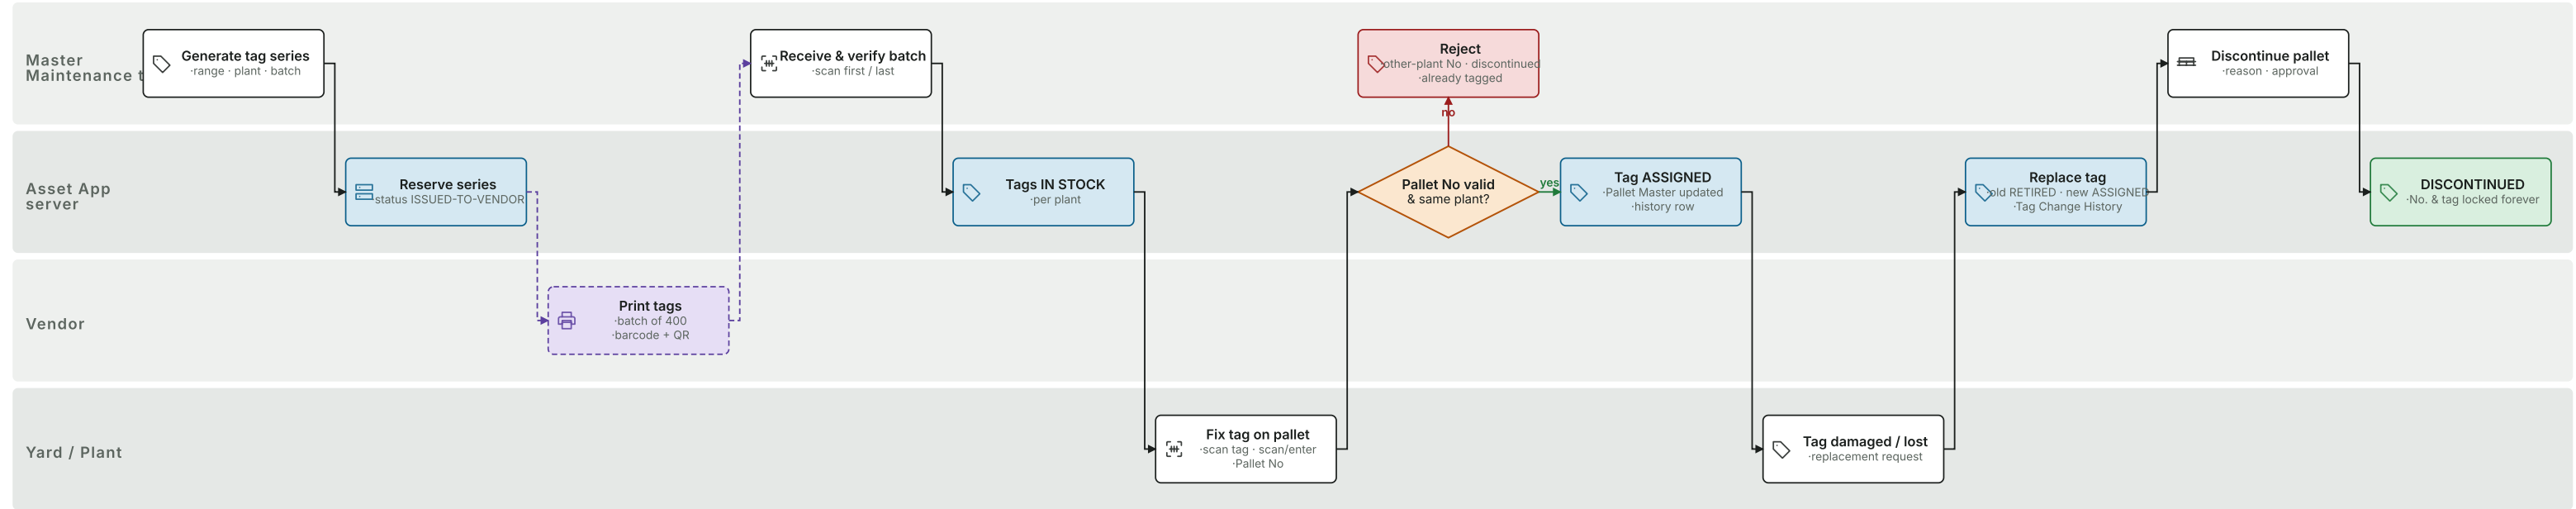

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Rules: Pallet No is permanent and never reused. A tag is assigned to one pallet at a time; a retired tag is never reassigned. Only the Master team can create series, replace tags or discontinue pallets.

New pallets: Pallet No is generated from the plant series when a new pallet is registered; tag assigned at the same time.

Audit: Every master change writes who / when / old value / new value. Tag Change History and Pallet History reports read from this log.

Inter-plant transfer: Changing Home Plant is a Master-team action with approval; it moves the pallet to the new plant series mapping without changing the Pallet No.

PROCESS 7 / 8

Reminders, Aging & Reporting

Nightly job against Customer Master limits; dashboards for plant and management

Manual / scan step

Asset app function

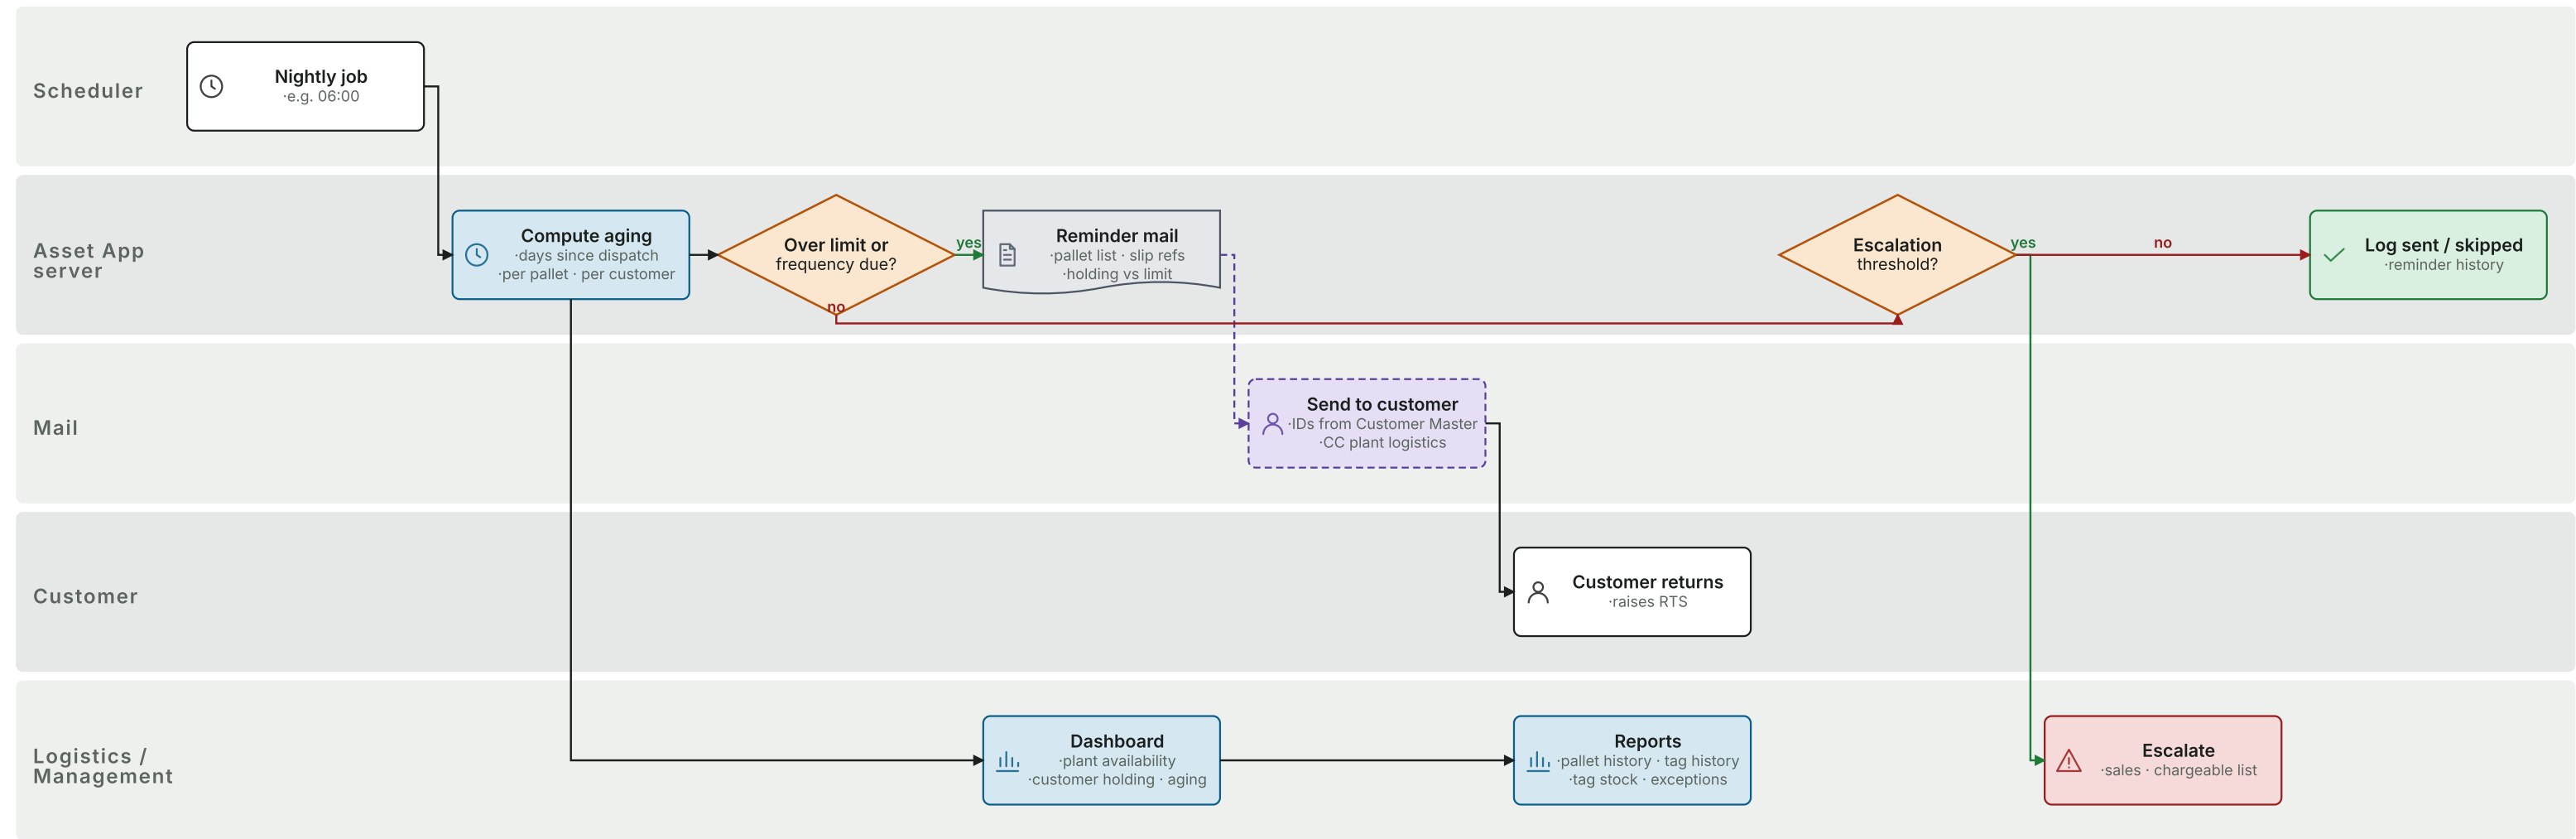

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Customer Master fields: holding-days limit, reminder frequency (e.g. every 7 days after limit), escalation days, chargeable flag, mail IDs, CC list.

Mail content: Customer name, plant, pallet count by age bucket (0-30 / 31-60 / 60+), slip references, and a link to the self-service page in Phase 6.

Dashboard: Plant-wise Available / At Customer / In Return / Held / Damaged / Discontinued; top-10 customers by holding; overdue trend.

Exports: All reports export to Excel; pallet history also prints as a single-pallet PDF.

PROCESS 8 / 8

Roles, Plant Restriction & User Control

15 plants · every user tied to one plant · role matrix maintained in Admin · supervisor PIN on sensitive actions

Manual / scan step

Asset app function

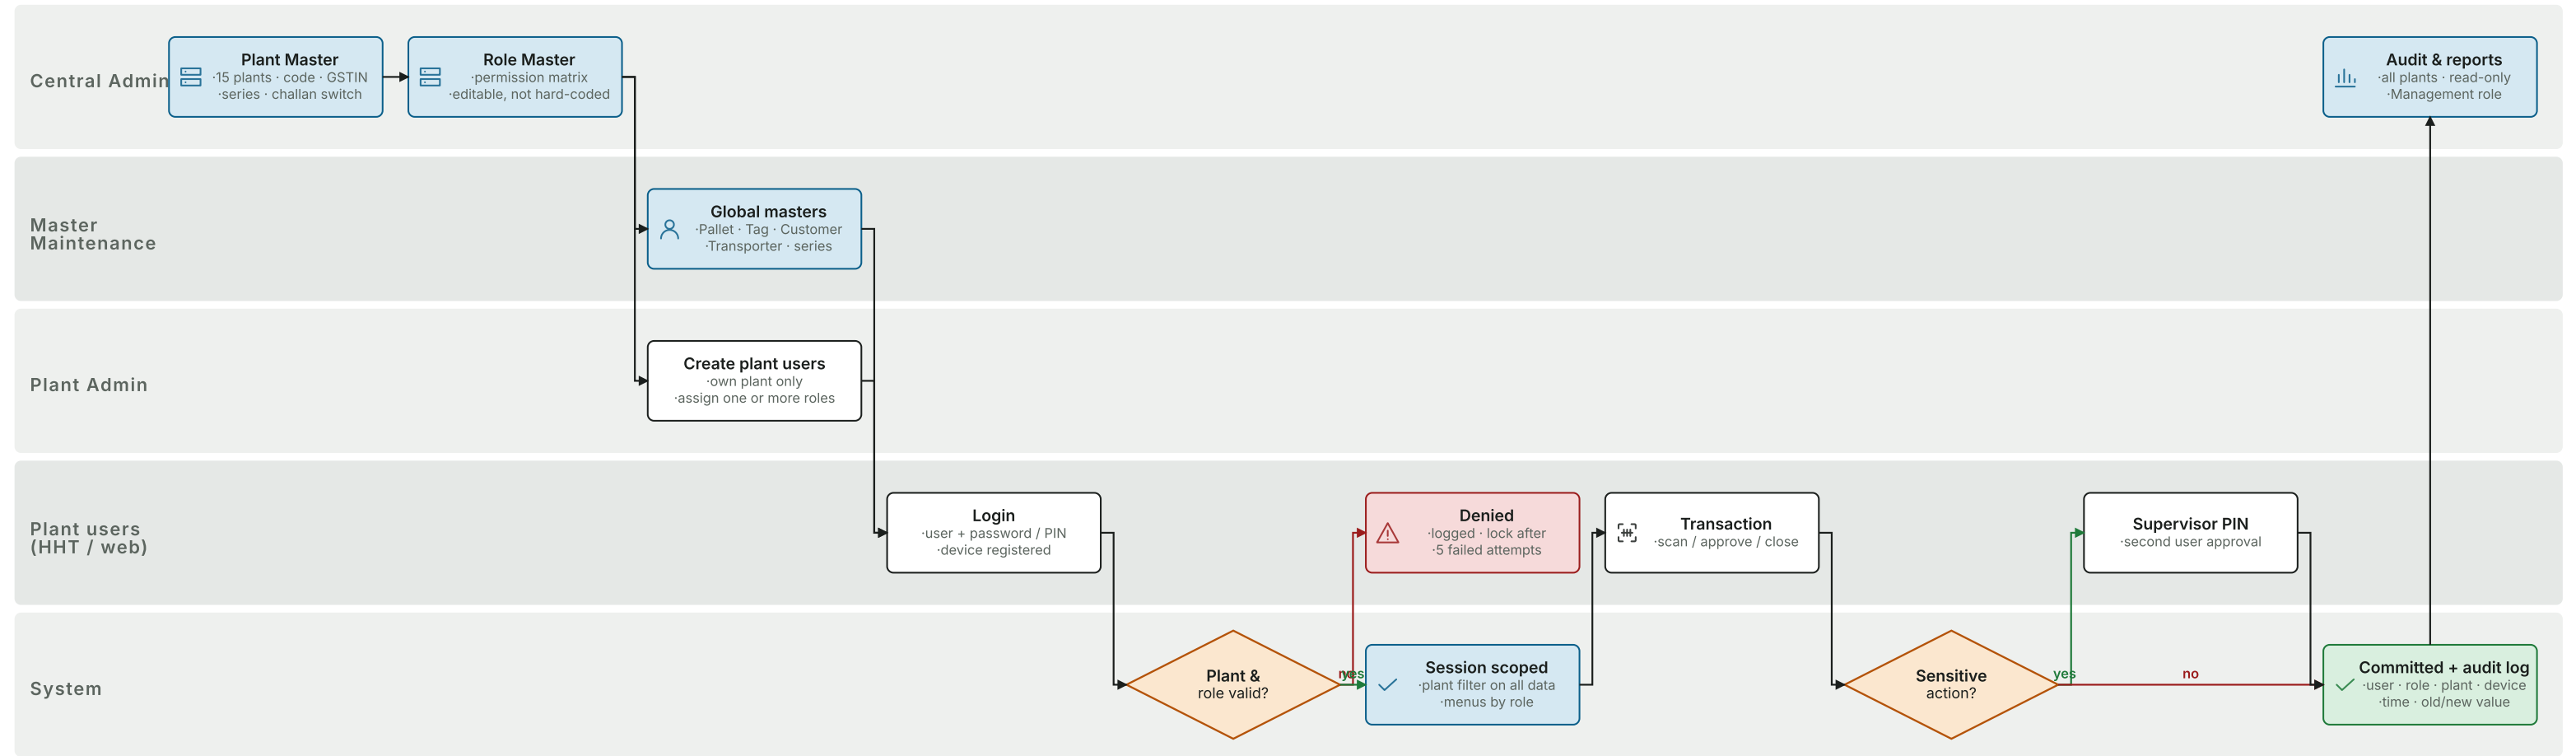

Decision / control

External system (EBS · GCS · Production · Mail)

Document / print

Normal end state

Exception

Plant roles: Security IN Gate · Security Logistics/OUT Gate · Pallet Yard In-charge · FG Warehouse · QA/PDI · Logistics. Full permission matrix in the master template (sheet 2_Roles).

Admin roles: Plant Admin (users and settings of own plant) · Master Maintenance (global masters, tag series, discontinue, inter-plant transfer) · Central Admin (everything,

integrations) · Management (all-plant dashboards, read-only).

Plant restriction: One plant per user; Central and Management roles are multi-plant. Data, scans, reports and pick lists are filtered automatically. A plant cannot dispatch or assign another plant’s pallets.

Sensitive actions (PIN): Close reconciliation with open exceptions · reduce pick list qty · manual GCS override · discontinue pallet · change home plant · delete user.

Security policy: Password rules, forced change on first login, lock after 5 failures, HHT device registration, immutable audit log. AD/LDAP optional later.
